Memorandum

Project #: R205114.000

From: Chris Bahret, PE
Transportation Engineer, VHB

Re: 3905 Page Road Industrial Trip Generation
Durham, NC

This memorandum provides an assessment of the trip generation (site generated traffic volumes) for a proposed industrial development at 3905 Page Road in Durham, NC.

Project Background

The development at 3905 Page Road is located at the intersection of Page Road (SR 1973) and Airport Road (SR 1971), with frontage along both roadways. The concept plan is shown in Figure 1 below and available in the Appendix located at the end of the memo. Although the specific tenant has not been identified, the development is planned to be a single industrial building for light industrial use. The total building square footage in the concept plan is 132,080 sf; however, the analysis assumes up to 150,000 sf to provide a conservative buffer for minor changes to the building. Access is proposed via two (2) driveways on Page Road and two (2) driveways on Airport Road.

Figure 1: Concept Plan (also available at the end of the memo)

Trip Generation

Trip generation estimates were prepared using the *Institute of Transportation Engineers (ITE) Trip Generation Manual, 12th Edition*. ITE Land Use Code (LUC) 110 (Light Industrial) was applied to reflect the anticipated use of the site. The resulting daily and peak-hour trips for the development are summarized in [Table 1](#) below.

Table 1: Trip Generation - 3905 Page Road Development in Durham, NC

LUC ¹	Land Use	Unit	ADT	AM Peak Hour			PM Peak Hour		
				Enter	Exit	Total	Enter	Exit	Total
Total Site Trips ²									
110	Light Industrial	150,000 sf	540	62	10	72	18	56	74

Notes:

1. Land Use Code and trip generation rates are determined based on *ITE Trip Generation, 12th Edition*
2. Total site trips are determined based on the ITE average rates

Background Traffic Volumes

Based on NCDOT count data, Page Road (SR 1973) carries an Annual Average Daily Traffic (AADT) volume of 11,000 vehicles per day (vpd) south of Airport Road, where the site driveways are proposed, and 7,100 vpd north of Airport Road (2023). Historical counts indicate growth of approximately 1.8 to 5.1 percent per year south of Airport Road over the past ten years, with relatively flat volumes north of Airport Road; a 3.0 percent compound annual growth rate was conservatively applied corridor-wide. Consistent with the City of Durham TIA guidelines, which require the analysis to examine expected traffic conditions one year after the project is scheduled to be complete, background volumes were projected to a 2028 Build year (assuming a 2027 opening), resulting in approximately 12,800 vpd south of Airport Road and 8,200 vpd north of Airport Road.

Conclusion

Based on the trip generation results in [Table 1](#), the proposed development is anticipated to generate 72 trips during the weekday AM peak hour and 74 trips during the weekday PM peak hour, fewer than 150 trips during both peak hours. Therefore, a Traffic Impact Analysis (TIA) is not required for the 3905 Page Road development under the City of Durham Unified Development Ordinance (UDO) Section 3.3 threshold. Given the relatively low site trip generation compared to existing and projected background volumes along Page Road, the development is expected to have a minor traffic impact to the area.
